A Catalogue of the Fishes of Japan

By

and

John Otterbein Snyder

Associate Professor of Zoology in Stanford University.

This memoir consists of a list of the species known to inhabit the waters of Japan, exclusive of the Riukiu Islands on the south, but including the Kuril Islands on the north. The Kuril Islands have the same general fauna as northern Hokkaidō, while the fauna of Riukiu is distinctly tropical, its species being largely the same as those of Formosa and the Philippines and therefore greatly different from those of the four great islands, Honshū, Hokkaidō, Shikoku and Kiūshū, which constitute Japan proper.

This paper is based primarily on the collections obtained by Professors JORDAN and SNYDER in Japan in 1900, on those obtained by Professor SNYDER in 1906, and on the collections in the Tōkyō Imperial University and those of the Tōkyō Imperial Museum.

The first systematic catalogue of the fishes known from Japan is contained in the great work of TEMMINCK and SCHLEGEL, published at Leyden from 1842 to 1850. This finely illustrated volume contains full accounts of the specimens obtained by BÜRGER in the vicinity of Nagasaki, with excellent copper plates of most of the species. Subsequently many species were described by GÜNTHER from the British

Museum collections, by HILGENDORF from collections made by himself about Tōkyō, and by STEINDACHNER and DÖDERLEIN from collections made by the latter naturalist about Tōkyō, Kōchi and Kagoshima. Two local catalogues were published by Japanese authors, the one by NAMIYE in 1881 (Classified Catalogue of the Specimens of Vertebrates in the Collections of the Educational Museum) and the other by ISHIKAWA and MATSUURA in 1897 (Preliminary Catalogue of Fishes, including Dipnoi, Cyclostomi and Cephalochorda in the Collection of the Natural History Department, Imperial Museum). In 1901, all these scattered records were gathered together as a Preliminary Check List of the Fishes of Japan by JORDAN and SNYDER published in the *Annotationes Zoologicae Japonenses* of the Tōkyō Zoological Society. In that Check List, 686 species were included, many of them only nominally known and many not really belonging to the fauna of Japan proper. In the same year Professors JORDAN and SNYDER visited Japan, making large collections at various points from Otaru to Nagasaki. The results of this exploration, including over 250 species not previously recorded from Japan, have been made known in a series of memoirs in the Proceedings of the United States National Museum, written by Dr. JORDAN with the aid of his associates, GILBERT, SNYDER, STARKS, RICHARDSON, FOWLER, HERRE, SEALE and THOMPSON. These papers will give Japanese workers a basis for local studies in bringing together the scattered literature of the subject and indicating the names the different species should properly bear under the rules of nomenclature accepted by the zoologists of the world. A second expedition under direction of Professors GILBERT and SNYDER in charge of the steamer "Albatross" was made in 1906. Of the specimens obtained, only the shore species have been thus far recorded. The deep-sea species, upwards of 200 in number, are yet to be recorded by Professor GILBERT.

Since 1906, numerous papers have been written on Japanese fishes. Dr. SCHMIDT of St. Petersburg has described his collections from the Oehotsk Sea. Dr. BASHFORD DEAN has written on collections from Misaki, Sagami. Specimens obtained by the veteran collector, Mr. ALAN OWSTON of Yokohama, have been described in various museums of the

world by TANAKA, GARMAN, PIETSCHMANN, HUSSAKOF and others. Many species have been described in Japan by ISHIKAWA, KISHINOUYE, TANAKA, ŌTAKI, MATSUBARA and NAKAGAWA. The specimens in the British Museum have been studied by REGAN. The collections of Dr. HUGH M. SMITH have been recorded in Washington by SMITH and POPE. Very recently, Dr. FRANZ has described the extensive collections made by Dr. DOFLEIN.

In the present catalogue, all these records have been brought together to the date of February 1, 1913. The number of species included in this list is 1230.

The fish fauna of Japan is one of extraordinary richness. Many additional species from the tropics will be found to drift northward in the Kuroshio. The deep-sea fauna is for the most part, as above indicated, yet to be made known, and large accessions of subarctic species will appear on more extensive explorations of Hokkaidō.

In this catalogue, Japanese names have been attached to nearly all the species. It scarcely needs to be pointed out that, in the vernacular, one and the same fish species has often several names, that it may have different names in different localities, or that the same name may have locally different applications. Where more than one Japanese name are given to a species, the one mentioned first is that which is most generally in use. Locality name in parenthesis and affixed to a Japanese fish name indicates where that name is commonly used for the species concerned. In the cases of species for which no vernacular name apparently exists, attempts were made to introduce one, for the convenience of those to whom scientific names are of no avail.

The illustrations used are all taken from the several papers in which Japanese fishes have been published in the United States, especially from those which appeared in the Proceedings of the United States National Museum, in the Bulletin of the Bureau of Fisheries and in JORDAN and EVERMANN'S Fishes of North and Middle America. The insertion of those figures, it is hoped, will greatly augment the usefulness of the catalogue.
